

What's New with Version 2.2

The following is a list of changes and new features with NEware V2.2. For more information, please refer to NEware's Online Help.

- You can now set **Safe Mode Access Cards** from within NEware. This feature is only available in NEware if there is an Access Control Module (DGP2-ACM1P) V2.0 or higher connected to, and programmed in, your security system.

If the Safe Mode feature is enabled, DGP2-ACM1P enters into Safe Mode when a communication loss occurs between the DGP2-ACM1P and the control panel and lasts longer than 30 seconds. When in Safe Mode, the access control door that is connected to the affected DGP2-ACM1P will grant access to up to four designated Safe Mode Access Cards only.

- Improved communication between the DigiplexNE control panel and the NEware software.
- Improved the door status function within System Monitoring.
- Improved the data transfer function with regard to the Access Control Module (DGP2-ACM1P).
